Roman Numerals

Roman numerals were
 the standard numbering **I = 1**
 system and method of **V = 5**
 arithmetic in ancient **X = 10**
 Rome and Europe. It **L = 50**
 uses a combinations of **C = 100**
 letters from the Latin
 alphabet to signify
 values

When reading roman numerals, we
 first start by finding the largest
 letter value in the sequence of
 letters. The Super Bowl this year
 will be

XLVII

The letter with the largest value
 in that sequence is L. L = _____.
 Now, any letter before the largest
 number will be subtracted from
 it's amount. In this case there is a
 X in front of the L. X = _____. So L
 - X = _____. Everything after
 the largest number is than added
 to that total. We have a V which is
 equal to _____ and two I's whos
 value is _____. Now lets put
 it all together.

L - X + V + I + I = _____
